## **Who Wants to Test Anyway? Bulletproof, Problem-free Java EE**

In (enterprise) development testing often is treated very much as poor relations. But for more than „Hello World“ applications testing is not just nice to have (at the end of the project) rather than crucial for working software.

This session shows how Java EE application are tested in a productive yet comprehensive way, why it is indispensable to do system tests and why are integration test frameworks like Arquillian overrated for most of the use cases. Most of the time is be spent live-coding and of course live-testing.

In this session I will explain how to test Java EE enterprise applications with a maximum coverage but still acceptable developer productivity. I'll explain the different scopes of tests and live-code several comprehensive examples. Furthermore I'll show how a full Continuous Delivery pipeline including system tests could look like.
